HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

Gaussian Processes Indexed by Clouds of Points: a study

Context And Problematic

- Metamodel a function over clouds of points using Gaussian process.
- A cloud is a set of points invariant under permutation $\{x_1, \dots, x_n\}$ with $x_i \in \mathbf{R}^{\text{dim}}$

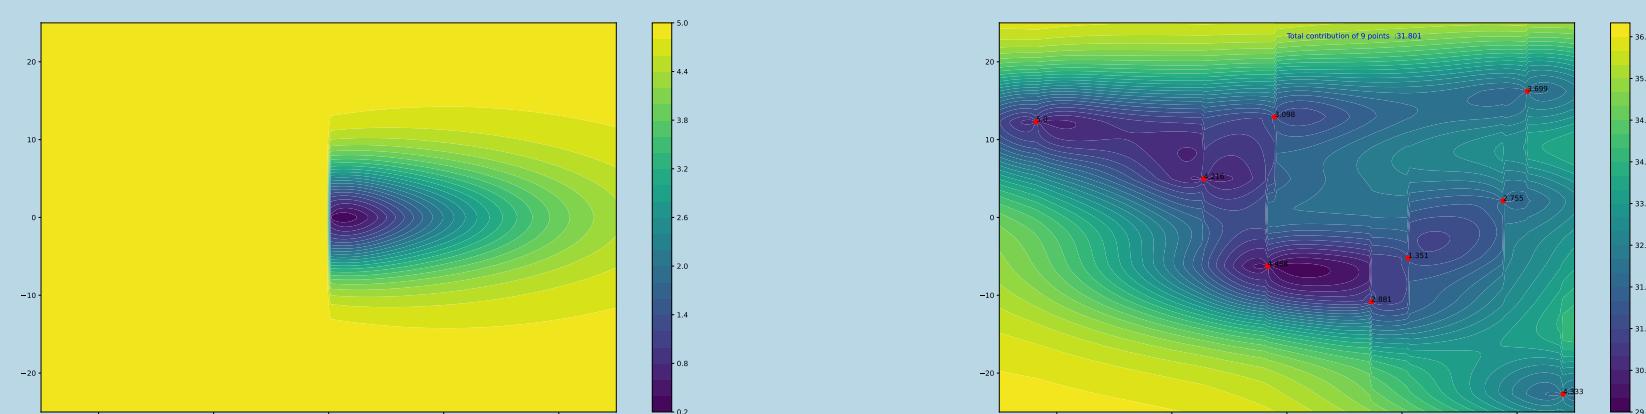

Test Function

The following test function mimicks a wind-farm production:

$$F(\{x_1, \dots, x_n\}) = \sum_{i=1}^n \sum_j f_p(x_j, x_i) f_0(x_i)$$

$x_{j,1} \leq x_{i,1}$

where $f_p(x_j, x_i)$ expresses the energy loss over x_i that is caused by x_j and f_0 is a constant.

Kernels

Substitution kernel with MMD

- We want to construct a kernel between two clouds of the form $K(X, Y) = \sigma^2 \exp(-\frac{d^2(X, Y)}{2\theta^2})$ where d is an Hilbertian [2] distance.
- For two clouds $X = \{x_1, \dots, x_n\}$ and $Y = \{y_1, \dots, y_m\}$, $P_X = \frac{1}{n} \sum_{i=1}^n \delta_{x_i}$ and $P_Y = \frac{1}{m} \sum_{j=1}^m \delta_{y_j}$ are the respective associated empirical uniform distributions.
- There exists a Reproducing Kernel Hilbert Space, \mathcal{H} with a characteristic kernel such as $k_{\mathcal{H}}(x, .) = \exp(-\frac{\|x - .\|^2}{2\theta^2})$.
- The characteristic nature guarantees the injectivity of the embedding map [1]: $P_X \mapsto \mu_X = \int P_X(x) k_{\mathcal{H}}(x, .) dx$.
- $MMD^2(P_X, P_Y) = \|\mu_X - \mu_Y\|_{\mathcal{H}}^2$
- For any kernel $k_{\mathcal{H}}$ of the RKHS, the uniform empirical laws gives $MMD^2(P_X, P_Y) = \frac{1}{n^2} \sum_{i=1}^n \sum_{j=1}^n k_{\mathcal{H}}(x_i, x_j) + \frac{1}{m^2} \sum_{i=1}^m \sum_{j=1}^m k_{\mathcal{H}}(y_i, y_j) - 2 \frac{1}{nm} \sum_{i=1}^n \sum_{j=1}^m k_{\mathcal{H}}(x_i, y_j)$
- The correlation kernel $K_{\text{sub_mmd}}(X, Y) = \sigma \exp(-\frac{\|\mu_X - \mu_Y\|_{\mathcal{H}}^2}{2\theta^2})$ is symmetric and definite positive.

Geometrical Properties of the kernels

- Below is represented the correlation between a cloud and its image by a geometric transformation. Considered transformations are rotations and translations.
- We compare two scenarios: centered clouds and non-centered ones.
- The different kernels of the Hilbertian Space are the Exponential, the Gaussian(Squared Exponential), the Matern32 and the Matern52.

centered cloud

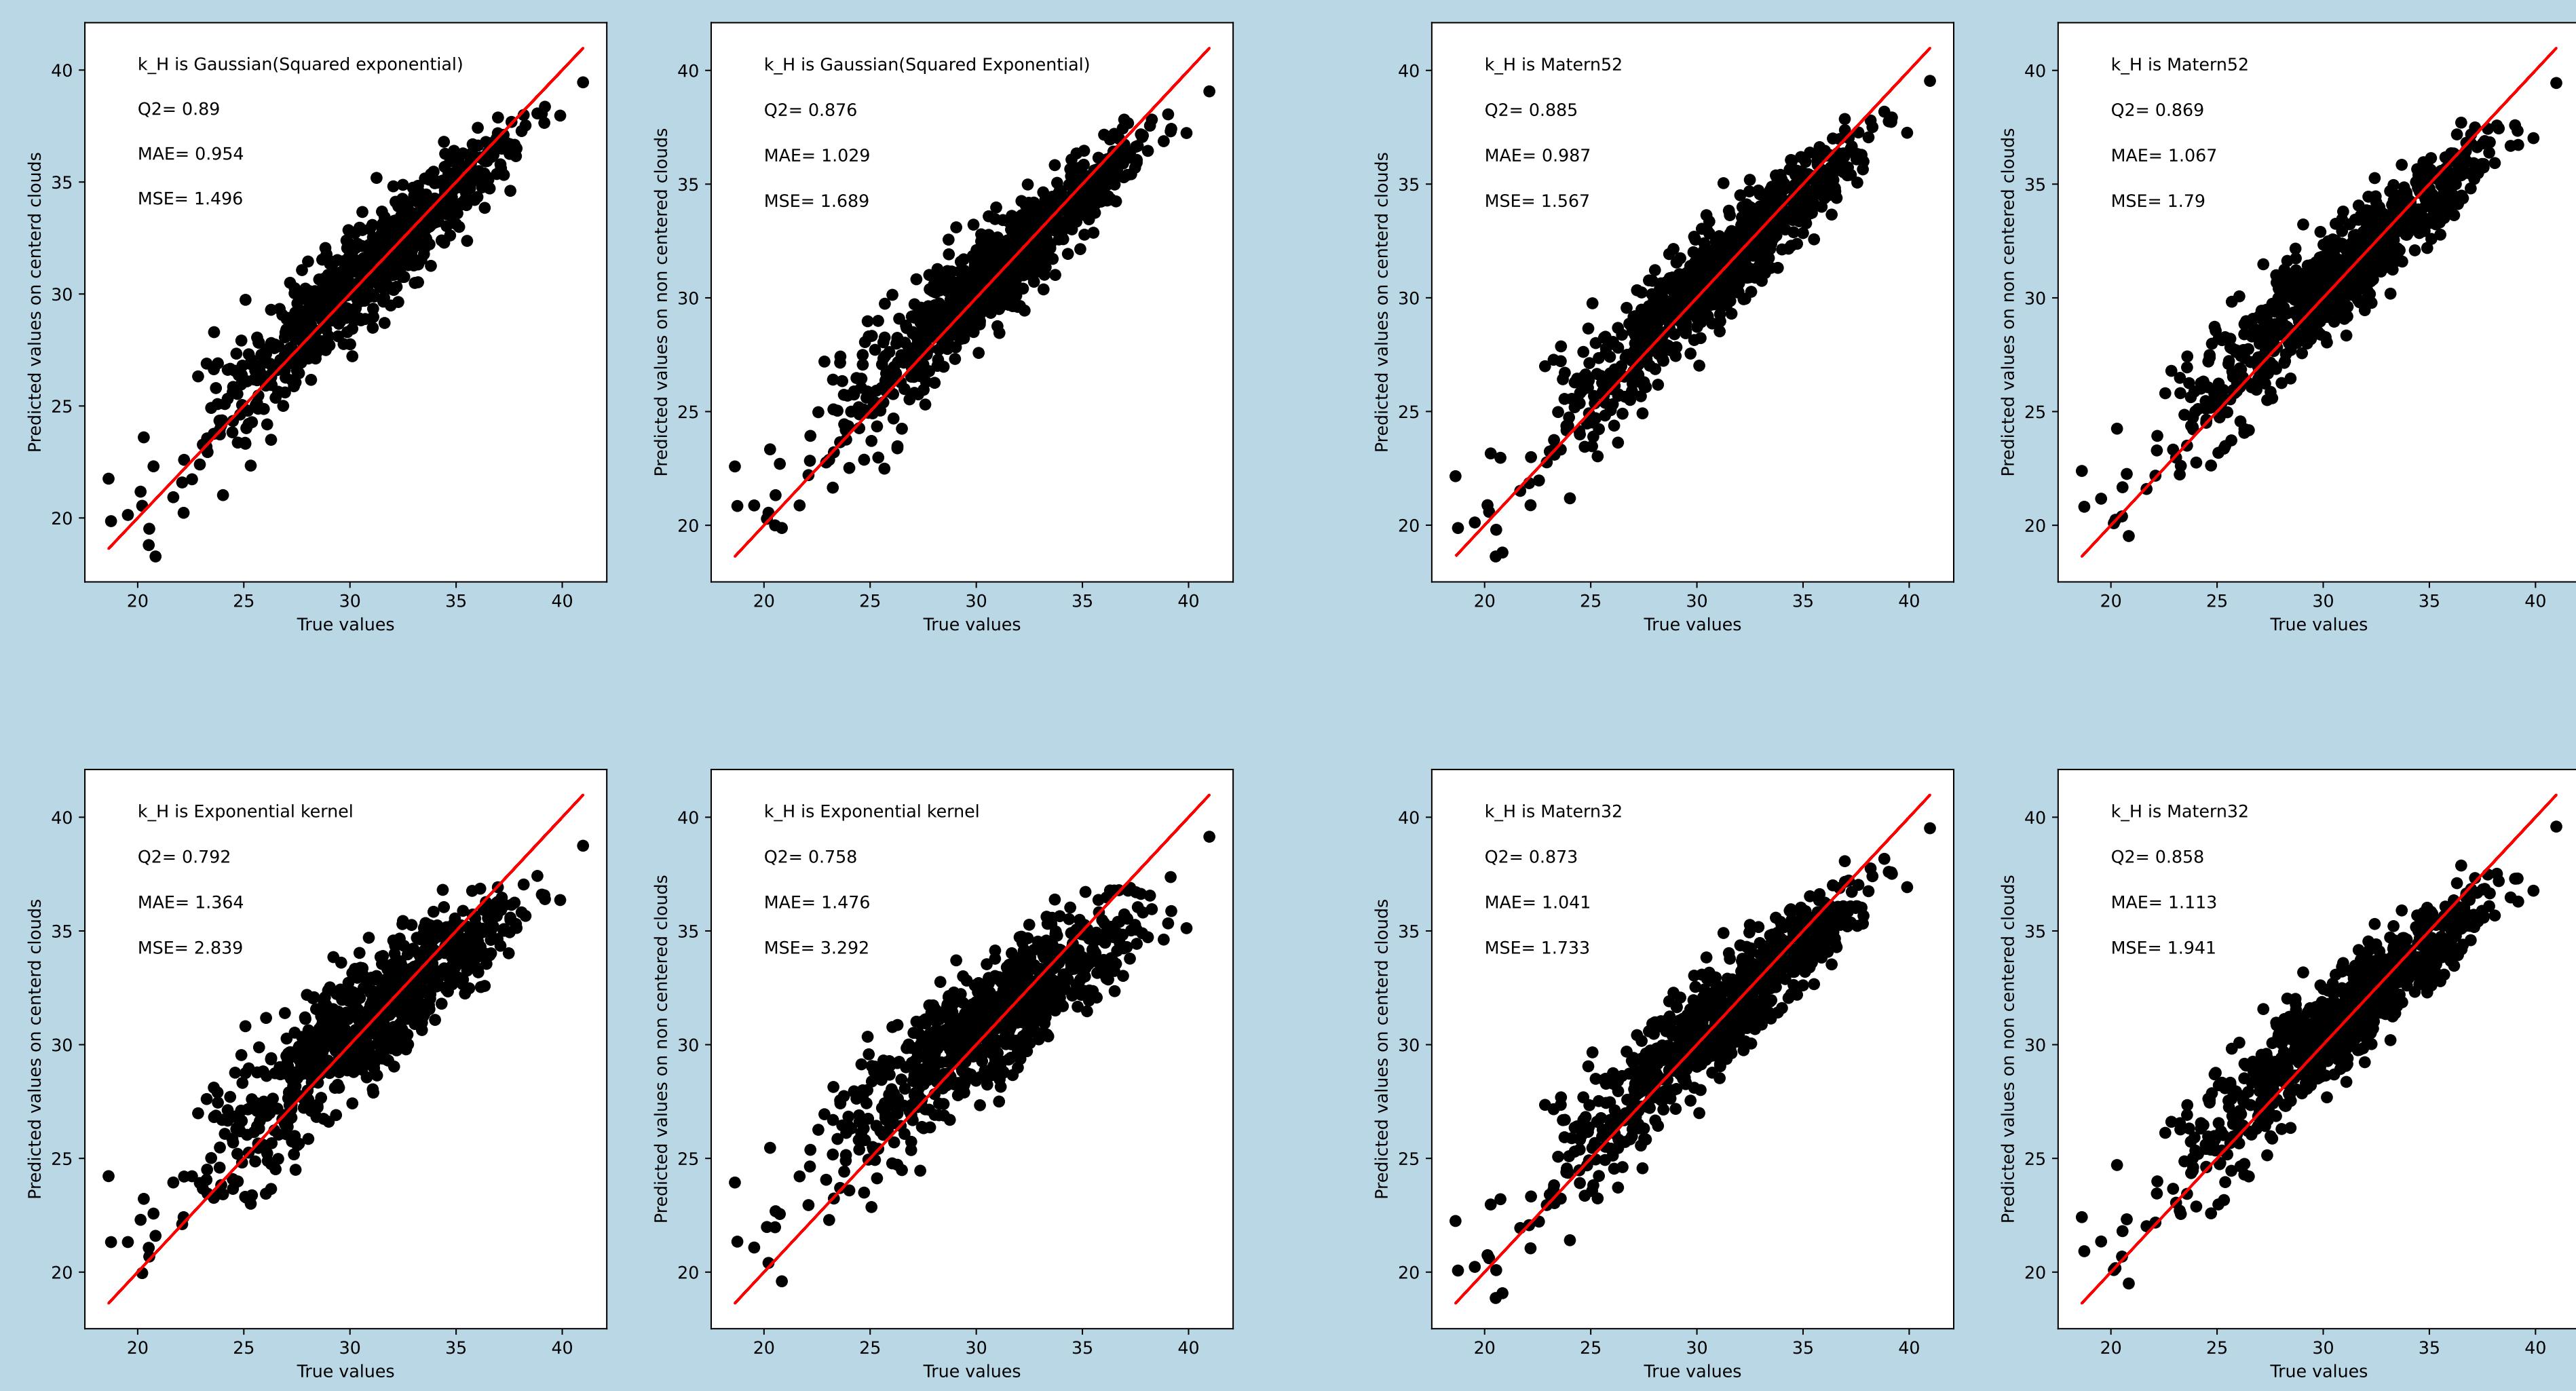

non-centered cloud

Prediction Results on the analytical Function F

- We metamodel the wind-farm proxy function F with a Gaussian process of kernel $K_{\text{sub_mmd}}$
- We consider a set of 1000 clouds of 10 points each.
- Each point of a cloud is drawn uniformly in a square.
- The kernel parameters are learned using 200 clouds by maximizing log-likelihood with BFGS.
- On each plot, we represent predicted values vs. true ones on the remaining clouds, obtained with the different kernels.
- The corresponding Q2, MAE and MSE are also displayed.

- The best results are obtained when k_H is the Squared Exponential and clouds are centered. This can be explained by the fact that the quadratic modified distance with two length scales of this k_H complies better with the geometric properties of F .
